1493: Uncovering The New World Columbus Created

Synopsis

A deeply engaging new history of how European settlements in the post-Colombian Americas shaped the world, from the bestselling author of 1491. Presenting the latest research by biologists, anthropologists, archaeologists, and historians, Mann shows how the post-Columbian network of ecological and economic exchange fostered the rise of Europe, devastated imperial China, convulsed Africa, and for two centuries made Mexico City "where Asia, Europe, and the new frontier of the Americas dynamically interacted" the center of the world. In this history, Mann uncovers the germ of today's fiercest political disputes, from immigration to trade policy to culture wars. In 1493, Mann has again given readers an eye-opening scientific interpretation of our past, unequaled in its authority and fascination.

Guest Reviewer: Nathaniel Philbrick on 1493 by Charles C. Mann Nathaniel Philbrick is the author of the New York Times bestsellers *The Last Stand*; *In the Heart of the Sea*, which won the National Book Award; *Sea of Glory*, winner of the Theodore and Franklin D. Roosevelt Naval History Prize; and *Mayflower*, which was a finalist for the Pulitzer Prize in history and one of the New York Times' ten best books of the year. He has lived on Nantucket since 1986. I'm a big fan of Charles Mann's previous book 1491, in which he provides a sweeping and provocative examination of North and South America prior to the arrival of Christopher Columbus. It's exhaustively researched but so wonderfully written that it's anything but exhausting to read. With his follow-up, 1493, Mann has taken it to a new, truly global level. Building on the groundbreaking

work of Alfred Crosby (author of *The Columbian Exchange* and, I'm proud to say, a fellow Nantucketer), Mann has written nothing less than the story of our world: how a planet of what were once several autonomous continents is quickly becoming a single, a globalized entity. Mann not only talked to countless scientists and researchers; he visited the places he writes about, and as a consequence, the book has a marvelously wide-ranging yet personal feel as we follow Mann from one far-flung corner of the world to the next. And always, the prose is masterful. In telling the improbable story of how Spanish and Chinese cultures collided in the Philippines in the sixteenth century, he takes us to the island of Mindoro whose southern coast consists of a number of small bays, one next to another like tooth marks in an apple. We learn how the spread of malaria, the potato, tobacco, guano, rubber plants, and sugar cane have disrupted and convulsed the planet and will continue to do so until we are finally living on one integrated or at least close-to-integrated Earth. Whether or not the human instigators of all this remarkable change will survive the process they helped to initiate more than five hundred years ago remains, Mann suggests in this monumental and revelatory book, an open question. A Letter from Charles C. Mann It looked an ice cream cone. But when I came closer, I realized that the boy was eating a raw sweet potato. His father had whittled at the top to expose the orange flesh, which the boy was licking; the unpeeled bottom of the sweet potato served as a handle. This was at a farm about 300 miles northwest of Shanghai. Sweet potatoes are often eaten raw in rural China--a curiosity to Westerners like me. I didn't realize that I had been staring until the boy ran to seek the protection of his father, who was hoeing a row of sweet potatoes. The father glared at me as I waved an apology. Because I don't speak Chinese, I couldn't tell him that I had been staring not at his son, but at the sweet potato in his hand. Nor could I say that I was staring because the sweet potato was an emblem of four hundred years of convulsive global change. Sweet potatoes are native to Central America. Spanish ships carried them to Manila in the 1570s, and then a Chinese ship captain smuggled the vines past Spanish customs by wrapping them around ropes and coiling the ropes in a basket. He took the contraband plants to Fujian, in southeast China, across from Taiwan. It was a time of famine in China. The captain's son took the sweet potatoes to the governor of Fujian, who in turn ordered farmers to plant the fanshu (foreign tubers). The famine ended. Other regions took up sweet potatoes to solve their food problems. Millions of lives were saved. For three centuries the food of the Chinese poor was not rice but sweet potato. How did that Chinese kid get his sweet potato? Christopher Columbus. Scientists view Columbus as the man who inadvertently began an explosive global biological swap. After he established contact between the eastern and western hemisphere, thousands of plant and animal species ricocheted around the continents. It

was the biggest event in the history of life since the death of the dinosaurs. The Columbian Exchange, as historians call it, is why there are tomatoes in Italy, oranges in the United States, potatoes in Ireland, chili peppers in Thailand--and sweet potatoes in China. It also is a big part of the reason why the British lost the Revolutionary War, why Mexico City became the worldâ™s first truly international city, and why millions of African slaves were transported unwillingly across the Atlantic. Indeed, these are among the subjects of my book, which is largely about the Columbian Exchange. The sweet potato--along with another American import, corn--did help save China from the calamity of famine. But they also caused another calamity. Traditional Chinese agriculture focused on rice, which had to be grown in wet river valleys. Sweet potatoes and corn could be grown in Chinaâ™s dry highlands. Armies of farmers went out and cleared the forests on these highlands. The result was catastrophic erosion. Silt filled the Yangzi and Huang He (Yellow) rivers, setting off huge floods that killed millions of people. It was like one Katrina after another, a Chinese scientist told me. Beset by disaster, China fell behind in the race for global supremacy. All of this history was encapsulated in the boy and his sweet potato, though he didnâ™t know it. To him, it was just a snack. When I took out my camera, the boyâ™s father rolled his eyes in disbelief. But I was taking a picture of centuries of global turbulence. The boy pouted; I clicked the shutter. Timeline for 1493

200,000,000 B.C.: Geological forces begin to break up the worldâ™s single giant continent, Pangaea, forever separating the hemispheres. After this, Eurasia and the Americas develop completely different suites of plants and animals. 1493 A.D.: Columbus sails on second voyage, establishing the first consequential European settlement in the Americas. Without intending to, he ends the long separation of the hemispheresâ™ and sets off the ecological convulsion known as the Columbian Exchange. 1518: In the first environmental calamity of the modern era, accidentally imported African scale insects in Hispaniola lead to an explosion of fire ants. Spaniards flee the ant-infested island in droves; colonists in Santo Domingo hold procession in honor of St. Saturninus, praying for his aid against the insect plague. 1545: Spaniards discover the worldâ™s biggest silver strike in Bolivia. In the next century, the worldâ™s supply of this precious metal will more than double, giving Europe an economic edge that will help it colonize Africa, Asia and the Americas. 1549: Initial appearance of tobaccoâ™ the addictive American drug that becomes the first global commodity crazeâ™ in China. That same year, HernÃ¡n CortÃ©s inaugurates the human part of the Columbian Exchange by signing the first contract to import large numbers of Africans to the American mainland. 1571: Miguel LÃ©pez de Legazpi colonizes Manila and establishes continual trade with Chinaâ™ Columbusâ™ life-long, never-fulfilled dream. Knitting the entire inhabited planet into a single web of trade, Legazpiâ™s actions are the beginning of todayâ™s economic

globalization. ~1615: Earthworms come to northern North America in English ship ballast. During the next three centuries, they will re-engineer forests from Ohio Valley to Hudson Bay. 1630-60: The gush of American silver finally causes its price to collapse, setting off a the worldâ™s first global economic calamity. 1644: Collapse of Ming dynasty. Long struggle between remaining Ming in south and incoming Qing dynasty in north leads the latter to forcibly evacuate most of the southern coast; millions of dispossessed people pour into the mountains, where they grow maize and sweet potatoes, American crops first smuggled into China from Manila and other European bases. 1775: Franceâ™s Flour War, set off by high bread prices, persuades King Louis XVI to allow the pioneering nutritional chemist Antoine-Augustin Parmentier to stage a series of publicity stunts to persuade farmers to grow potatoes, a distrusted foreign species from Peru. Parmentierâ™s PR is so successful that broad swathes of northern Europe are soon covered with a monoculture of potatoes. 1781: Britainâ™s âœsouthern strategyâ• pushes Gen. Cornwallisâ™s army into North Americaâ™s malaria zone, an area dominated by malaria parasites introduced from Europe and Africa. Defeated by malaria, the British army surrenders to a general it never fought: George Washington. This ends the Revolutionary War. 1845: Europeâ™s potato monoculture, which is unlike anything ever seen in Peru, turns out to be especially vulnerable to another Peruvian import, the potato blight. Ravaging the continent from Russia to Ireland, the blight causes a famine that kills an estimated two million people, half of them in Ireland. ~1867: LÃ©opold Trouvelot, French amateur entomologist, smuggles gypsy moths to Medford, Mass., hoping to breed them with native silk-producing moths to produce a more robust silk-producer. Their almost immediate escape sets off an invasion that continues today. Trouvelot hurriedly returns to France before the dimensions of the problem can be known. 1880-1912: Industrializing nations, desperate for the elastic belts, pliable gaskets and the absorbent tires needed by steam engines and vehicles, buy every scrap of rubber they can get from the â™s rubber trees, the sole source of high-quality latex. The ensuing rubber boom collapses after an Englishman smuggles rubber trees out of Brazil. Soon much of southeast Asia is covered with this foreign tree. 1979: The golden apple snail is sent from Brazil to Taiwan to launch an escargot industry there. It escapes, proliferates, and becomes a major menace to the islandâ™s rice crop. --This text refers to an alternate Paperback edition.

He is not a professional historian, but most professionals could learn a lot from the deft way he does this. . . *1493* is thoroughly researched and up-to-date, combining scholarship from fields as varied as world history, immunology, and economics, but Mann wears his learning lightly. He serves up one arresting detail after another, always in vivid language. Most impressive of all, he manages to turn plants, germs, insects and excrement into the lead actors in his drama while still parading before us an unforgettable cast of human characters. He makes even the most unpromising-sounding subjects fascinating. I, for one, will never look at a piece of rubber in quite the same way now. . . The Columbian Exchange has shaped everything about the modern world. It brought us the plants we tend in our gardens and the pests that eat them. And as it accelerates in the 21st century, it may take both away again. If you want to understand why, read *1493*.â • â "The New York Times Book Review Â à œMann is trying to do much more than punch holes in conventional wisdom; heâ ™s trying to piece together an elaborate, alternative history that describes profound changes in the world since the original voyage of Columbus. What's most surprising is that he manages to do this in such an engaging way. He

writes with an incredibly dry wit. • "Austin American-Statesman" Mann's book is jammed with facts and factoids, trivia and moments of great insight that take on power as they accumulate. • "The Washington Post" Although many have written about the impact of Europeans on the New World, few have told the worldwide story in a manner accessible to lay readers as effectively as Mann does here. • "Library Journal" The chief strength of Mann's richly associative books lies in their ability to reveal new patterns among seemingly disparate pieces of accepted knowledge. They're stuffed with forehead-slapping "aha" moments. . . If Mann were to work his way methodically through the odd-numbered years of history, he could be expected to publish a book about the global impact of the Great Recession sometime in the middle of the next millennium. If it's as good as 1493, it would be worth the wait. • "Richmond Times-Dispatch" None of us could travel with Columbus in 1492. But that's OK, because in 1493 we can take an even more exhilarating ride. This powerful rethinking of the origins and consequences of globalization is so illuminating, it's scary. • "Carl Safina, author of *A Sea In Flames* and *The View From Lazy Point*" Almost mind-boggling in its scope, enthusiasm and erudition. . . Almost every page of 1493 contains some extraordinarily provocative argument or arrestingly bizarre detail. . . Ranging freely across time and space, Mann's book is full of compelling stories. . . A tremendously provocative, learned and surprising read. • "The Times of London

After his best-selling book, 1491: New Revelations of the Americas before Columbus, Charles Mann wrote a sequel, 1493: Uncovering the New World Columbus Created. 1491 reconstructs what North and South America were like before European contact, showing that the Americas were among the most densely populated regions of the world. Some of the cities in Mesoamerica and South America were bigger and more sophisticated than Europe's most advanced cities at the time. 1493 chronicles global changes resulting from the interaction between continents, what Mann calls the Homogenocene, rewriting global ecosystems through the transportation of immigrants, slaves, new crop plants, livestock, pests, and diseases. Mann shows how malaria imported from Africa shaped colonies and influenced slavery in the New World, and how African colonization was often a bigger force in reshaping the Americas than European colonization. He shows how exploited riches of gold and silver sparked global trade networks and enriched some, but also flooded the markets with such vast wealth as to devalue precious metals and cause economic collapse instead of prosperity. Mann follows the trail of American crops that were introduced to the rest of the world, such as potatoes, tomatoes, maize, sweet potatoes, and rubber, showing how American foods helped stabilize and

grow European populations, fueling global empire-building, and of course, crashes such as the Irish potato famine. From Asia to the Americas to Europe, Mann demonstrates how the discovery of the Americas reshaped the entire world, for better or worse, into a more homogenous mix of people, crops, and pests. It is a great read for understanding world history and the roots of globalization.

It is rare that an author has the talent to impart facts, attendant theories, and well researched history without putting his readers to sleep; Charles C. Mann is such an author and "1493" is such a book. Taking up where his earlier work, "1491", left off, Mann's continued historical explanation and analysis of the so called "Columbian Exchange" does much to inform his reader of when and how human caused globalization began to impact the western hemisphere and change Earth's ecosystems forever after. The exchange of plants, animals, viruses, bacteria, minerals and, perhaps most earth-shaking, human beings falls into an epoch that Mann labels the "Homogenocene", an era that continues to affect our world and its environments. This book - like 1491 - is well researched, well argued when Mann tilts toward theories of causation, and very well written overall. Two thumbs up! Or five stars even!

I am enjoying this book as an amateur history of spices buff. It is an eye opener for making one realize how isolated people were pre-Columbus and the effects of his exploration on opening up trade and culinary experiences around the world. It is fascinating learning out crops today that are important economic contributors to various countries were acquired post-Columbus. Rubber is a case in point. From South America to the vast plantations of SE Asia. Red peppers, the basis for many Thai and Chinese dishes were unheard of in these countries pre-Columbia. Some of these migrations were good, some was bad. Mr. Mann covers both sides of the story in a readable book.

This book is history that I've never read before, and probably most people haven't. You find out the cause for so many events in history and changes in our present day world. The writing is so interesting and easy to read, and the ideas are fascinating. They feel like things you really should have known all along, and really change the way you see the world, people, agriculture, the environment, business and governments. However, the one of the last parts of the book is about the history of interactions between the different races in South America in the first centuries after Columbus. And it was so boring, at least to me, that I skipped that part of the book. Not because the events weren't interesting, just the way it was presented. The accounts of interactions between people from different continents--Europe, the Americas, Africa, and Asia-- are some of the best

parts of the book, and quite eye-opening. It is ONLY that certain part near the end where the author does not tell the story in an engaging fashion, at least to me.

A very interesting read. I have always been interested in how foods or inventions are integrated into different cultures and how they affect civilizations. This is a well researched and well written documentation of the changes which occurred when the two worlds met after 1492. Very enjoyable. I bought the kindle version, as usual with books that you want to glance back through, it would be interesting to have a hard copy.

This is one of the five most important books I have read in my sixty-something years. Along with Mann's 1491, it shows how the Columbian Exchange ushered in an unintended "Homogenocene" Era which knitted together the long-separated parts of Pangaea. In plainer English, this book is about plants, animals, microbes, and human activity moving across the Atlantic and Pacific to build up and ruin different parts on the giving and receiving ends of each exchange. I learned about the huge Chinese navy of the early 1400's, the reasons for the potato famine in Ireland, the uses of piracy, the evil genius of mosquitoes, and the foolishness of rulers. The book is about globalization getting started long before there was such a word for it. Mann is a journalist more than he is a scholar, and a great and enthusiastic explainer.

~:"1493":~ sounds like a New Yorker Magazine article with further research, and recreation. It is very playful, like a USA movie about Latin America. It is respectful, and tedious, like any other engrossing reader. But best of all, it compliments Charles C. Mann's "1492", which is where I heard about it.
